

I would like to address the regulation for host sites. Right now the rules are that there can only be one host site per aggregated microgen. This may work in the residential scope but not for Ag or business. For example, many farmers have large loads and do not have the space close enough to achieve net zero in one location. Farmers also have many desirable locations such as dry land pivot corners. I am asking for the change to allow multiple host sites so net zero can be achieved in a smart way using proper unirrigated land.

thank you,

Mike Seely
